## 1. CERTIFICATION

---

EMG has completed an Energy Audit of Broadmeadow Elementary School located at 120 Broad Meadow Road in Needham, Massachusetts. EMG visited the site on August 18 and 19, 2011.

The assessment was performed at the Client's request using methods and procedures consistent with ASHRAE Level II Energy Audit and using methods and procedures as outlined in EMG's Proposal.

This report is exclusively for the use and benefit of the Client identified on the first page of this report. The purpose for which this report shall be used shall be limited to the use as stated in the contract between the client and EMG.

This report is not for the use or benefit of, nor may it be relied upon by any other person or entity, for any purpose without the advance written consent of EMG.

Estimated installation costs are based on EMG's experience on similar projects and industry standard cost estimating tools including *RS Means*. In developing the installed costs, EMG also considered the area correction factors for labor rates for Needham, MA. Since actual installed costs may vary widely for particular installation based on labor & material rates at time of installation, EMG does not guarantee installed cost estimates and shall in no event be liable should actual installed costs vary from the estimated costs herein. We strongly encourage the owner to confirm these cost estimates independently. EMG does not guarantee the costs savings estimated in this report. EMG shall in no event be liable should the actual energy savings vary from the savings estimated herein.

EMG certifies that EMG has no undisclosed interest in the subject property and that EMG's employment and compensation are not contingent upon the findings or estimated costs to remedy any deficiencies due to deferred maintenance and any noted component or system replacements.

Any questions regarding this report should be directed to Kalyana Vadala at 800.733.0660, ext. 6236.

## 2. EXECUTIVE SUMMARY

The purpose of this Energy Audit is to provide the Town of Needham and Broadmeadow Elementary School with a baseline of energy usage and the relative energy efficiency of the facility and specific recommendations for Energy Conservation Measures. Information obtained from these analyses may be used to support a future application to an Energy Conservation Program, Federal & Utility grants towards energy conservation, support performance contracting, justify a municipal bond funded improvement program, or as a basis for replacement of equipment or systems.

The school property has one, 2-story building containing 78,592 square feet consisting of offices, classrooms, auditorium, cafeteria, gym, mechanical and storage rooms. The site area is approximately 7 acres. Construction of the property was completed in 2001.

The study included a review of the building's construction features, historical energy, review of the building envelope, HVAC equipment, heat distribution systems, lighting, and the building's operational and maintenance practices.

Broadmeadow Elementary School currently has a central BMS system controlling the HVAC systems at the school.

### Summary of Existing Energy Performance

|                                      |                |
|--------------------------------------|----------------|
| Building's Annual Energy Consumption | 6,269,345 kBtu |
| Total Annual Energy Costs            | \$203,629      |

EMG has identified 11 Energy Conservation Measures (ECMs) for this property. The savings for each measure are calculated using standard engineering methods followed in the industry, and detailed calculations for ECM are provided in Appendix G for reference. A 10% discount in energy savings was applied to account for the interactive effects amongst the ECMs. In addition to the consideration of the interactive effects, EMG has applied a 15% contingency to the implementation costs to account for potential cost overruns during the implementation of the ECMs.

The following table summarizes the recommended ECMs in terms of description, investment cost, energy consumption reduction, and cost savings.

**Summary of Financial Information for Recommended Energy Conservation Measures**

| Item  | Estimate                                |
|---|---|
| Total Projected Initial ECM Investment        | \$74,035<br><i>(In Current Dollars)</i> |
| Estimated Annual Cost Savings Related to ECMs | \$28,495<br><i>(In Current Dollars)</i> |
| Net Effective ECM Payback                     | 2.60 years                              |
| Estimated Annual Energy Savings               | 14%                                     |
| Estimated Annual Cost Savings                 | 14%                                     |

| List of Recommended Energy Conservation Measures For Broadmeadow School |   |                              |                                 |             |                                |                      |                                     |                |

Apart from the above recommended measures, EMG has analyzed the following three measures for consideration and long term capital planning. These measures are not recommended at the current time due to high initial investment and long payback yielding negative life cycle savings, but recommend for at time of equipment replacement.

| Detailed List of Measures Evaluated For Consideration For Broadmeadow School |  |                    |                       |        |                      |                      |                                     |         |
|--|--|--------------------|-----------------------|--------|----------------------|----------------------|-------------------------------------|---------|
| ECM #  | Description of ECM   | Initial Investment | Annual Energy Savings |        | Annual Water Savings | Total Energy Savings | Total Estimated Annual Cost Savings | Payback |

### 3. BENCHMARKING/ENERGY PERFORMANCE SUMMARY

#### 3.1. ENERGY STAR PORTFOLIO MANAGER FACILITY SUMMARY

EMG uses the Portfolio Manager tool developed by the Federal Environmental Protection Agency to track relative energy uses of buildings by property type. This tool allows the input of a facility's historic utility data to be compared with normalized data of a large database of its peer facilities.

**Facility**

Needham: Broadmeadow School  
120 Broadmeadow Road  
Needham, MA 02492

**Facility Owner**

N/A

**Primary Contact for this Facility**

Bill Champion  
222 Schilling Circle Suite 275  
Hunt Valley, MD 21031

**General Information**

| Needham: Broadmeadow School                            |               |
|--|---------------|
| Gross Floor Area Excluding Parking: (ft <sup>2</sup> ) | 78,592        |
| Year Built   | 2001          |
| For 12-month Evaluation Period Ending Date:            | June 30, 2011 |

**Facility Space Use Summary**

| School  |             |
|---|-------------|
| Space Type                                    | K-12 School |

### 3.2. EPA ENERGY STAR RATING

---

The national energy performance rating is a type of external benchmark that helps energy managers to assess how efficiently their buildings use energy, relative to similar buildings nationwide. The rating system's 1-100 scale allows everyone to understand quickly how a building is performing. For example, a rating of 50 indicates an average energy performance, while a rating of 75 or better indicates top performance. The higher the rating, the better the building is performing. Organizations can evaluate energy performance among the buildings in their portfolio, while also comparing their performance with other similar buildings nationwide. Additionally, building owners and managers can use the performance ratings to help identify buildings that offer the best opportunity for energy improvement and recognition.

To receive the energy performance rating, facility-related data entered into the Portfolio Manager, must adhere to a series of operating and energy use conditions. If one or more of these conditions are not met, the facility will receive "N/A" (Not Available) as a rating. "NA" means that the Portfolio Manager is unable to calculate a rating for that particular period ending date, given the operating and energy use conditions provided.

A building must obtain a rating of 75 or better to be eligible to apply for the Energy Star Certification. However, a rating of 75 does not necessarily mean that a building will qualify.

---

### 3.3. SOURCE ENERGY AND SITE ENERGY

---

Buildings use a variety of forms of energy, including electricity, natural gas, fuel oil, and district steam. In order to provide an un-biased rating, the methodology must add together all of the energy used in a building. To combine energy in an equitable way, the ratings use source energy. Source energy is the energy that is consumed at the site, in addition to the energy used in generation and transmission.

The purpose of the conversion from site energy to source energy is to provide an equitable assessment of building-level energy efficiency. Because billed site energy use includes a combination of primary and secondary forms of energy, a comparison using site energy does not provide an equivalent thermodynamic assessment for buildings with different fuel mixes. In contrast, source energy incorporates all transmission, delivery, and production losses, which accounts for all primary fuel consumption and enables a complete assessment of energy efficiency in a building. When source energy is used to evaluate energy performance, an individual building's performance does not receive either a credit or a penalty for using any particular fuel type.

---

## 4. INTRODUCTION

---

The purpose of this Energy Audit is to provide Broadmeadow Elementary School with a baseline of energy usage, the relative energy efficiency of the facility, and specific recommendations for Energy Conservation Measures. Information obtained from these analyses may be used to support a future application to an Energy Conservation Program, Federal and Utility grants towards energy conservation, as well as support performance contracting, justify a municipal bond-funded improvement program, or as a basis for replacement of equipment or systems.

The energy audit consisted of an on site visual assessment to determine current conditions, itemize the energy consuming equipment (i.e. Boilers, roof-top-cooling units (RTU), DHW equipment); review lighting systems both exterior and interior; and review efficiency of all such equipment. The study also included interviews and consultation with operational and maintenance personnel. The following is a summary of the tasks and reporting that make up the Energy Audit portion of the report.

The following is a summary of the tasks and reporting that make up the Energy Audit portion of the report.

### ENERGY AND WATER USING EQUIPMENT

- EMG has surveyed the common areas, office areas, classrooms, maintenance facilities and mechanical rooms to document utility-related equipment, including heating systems, cooling systems, air handling systems and lighting systems.

### BUILDING ENVELOPE

- EMG has reviewed the characteristics and conditions of the building envelope, checking insulation values and conditions. This review also includes an inspection of the condition of walls, windows, doors, roof areas, insulation and special use areas. Where we anticipated significant losses, we utilized infrared thermographs to analyze heat loss across the envelope.

### RECOMMENDATIONS FOR ENERGY SAVINGS OPPORTUNITIES

- Based on the information gathered during the on site assessment, the utility rates, as well as recent consumption data and engineering analysis, EMG has identified opportunities to save energy and provide probable construction costs, projected energy/utility savings and provide a simple payback analysis.

### ANALYSIS OF ENERGY CONSUMPTION

- Based on the information gathered during the on site assessment and a minimum of one year of utility billing history, EMG has conducted an analysis of the energy usage of all equipment, and identified which equipment is using the most energy and what equipment upgrades may be necessary. As a result, equipment upgrades or replacements are identified that may provide a reasonable return on the investment and improve maintenance reliability.

### ENERGY AUDIT PROCESS

- Interviewing staff and review plans and past upgrades
- Performing an energy audit for each use type
- Performing a preliminary evaluation of the utility system
- Analyzing findings, utilizing ECM cost-benefit worksheets
- Making preliminary recommendations for system energy improvements and measures
- Estimating initial cost and changes in operating and maintenance costs based on implementation of energy efficiency measures
- Ranking recommended cost measures, based on the criticality of the project and the largest payback

### REPORTING

The EMG Energy Audit Report includes:

- A comprehensive study identifying all applicable Energy Conservation Measures (ECMs) and priorities, based on initial cost and payback
- A narrative discussion of building systems/components considered and a discussion of energy improvement options;
- A summary of ECMs including initial costs and simple payback based on current utility rates and expected annual savings.

## 5. FACILITY OVERVIEW AND EXISTING CONDITIONS

### 5.1. BUILDING OCCUPANCY

Typically, 650 students & 90 staff occupy the facility during normal operating hours. After hours occupants include approximately 30 people. School is generally occupied 100% in winter and 30% in summer. The Gym is open until 10PM everyday M-F during winter.

#### Summary of Facility Operating Hours

|   | Hours Open to the Public | Hours Open to Employees |
|---|--------------------------|-------------------------|
| Monday-Friday (Winter)                  | 8 AM-5 PM                | 6 AM-10 PM              |
| Saturday/Sunday<br>(Gym only in winter) | 8 AM-6 PM                |                         |
| Summer (Gym only)                       | 6 AM-8 AM everyday       |                         |

### 5.2. BUILDING ENVELOPE

The building envelope consists of the exterior shell, made up of the walls, windows, roof, and floor. The envelope provides building integrity and separates the exterior from the interior conditioned space.

Based on actual facility architectural drawings provided, the foundations consist of cast-in-place concrete perimeter wall footings with CMU foundation walls. The foundation systems include reinforced concrete column pads. The building has load-bearing, concrete masonry unit walls and interior steel columns. The upper floors and roofs are constructed with steel reinforced concrete with metal decking. The building structure appears to be in good condition.

The School has a 4 Ply Built-Up Pitched Roofing System with flood coat and aggregate surfacing. The built-up roof is over 2 ½" of polyisocyanurate insulation board. The roofs are in fair condition.

The exterior walls are concrete masonry units with 2 inches of rigid insulation in the air gap between the block interior and brick veneer exterior. The entry doors are commercial double pane steel doors in steel frames. All of the doors appear to be in good operating order although the door threshold seals on some of the exit doors (North End) have deteriorated weather seals indicating air leakage.

The following table describes the observed or reported insulation levels at the property:

| Item           | Construction Type  |
|----------------|--|
| Foundation     | Continuous Reinforced Concrete Slab  |
| Structure      | Block with Steel Substructure and Concrete Decks                                       |
| Exterior Walls | Brick/tile veneer/6" fiberglass batt on metal studs/5/8 <sup>th</sup> in. gyp board    |
| Roof           | 4 Ply Built-Up Pitched Built-Up-Roofing System with flood coat and aggregate surfacing |

The following table describes the insulation levels of different surfaces at the property based on provided facility drawings:

| Building Element  | Estimated Insulation |
|-------------------|----------------------|
| Roof              | R – 20               |
| Floors            | R – 30               |
| Walls Above Grade | R – 19.3             |

### 5.3. BUILDING HEATING, VENTILATION AND AIR-CONDITIONING (HVAC)

Heating is provided by two Weil-McLain "Series 88" cast iron sectional gas-fired hot water boilers operating in the lead-lag mode. The boilers were installed in 2001 during the original construction of the building and are in good condition. These are standard efficiency units with manufacturer rated values of 85.6% thermal efficiency and 72.2% IBR efficiency. The boilers are operational during the winter months and are turned off in summer. Based on facility natural gas profile, the boilers are operational from October through May. Hot water is circulated throughout the building by two 10 HP recirculation pumps. The hot water from the boilers is supplied to the baseboard hydronic heating system located along the exterior walls and the reheat coils in the VAV boxes located throughout the building. Currently the pumps do not have Variable Frequency Drive (VFD) controllers and run at constant speed all the time with the flow regulated by 3-Way valves in the hydronic coils in VAV boxes and perimeter radiators. The boilers have a water treatment system to maintain the water at its optimal pH level and prevent premature wear on pipes and boilers. The overall condition and maintenance of boiler/burner, pumps and piping is good. Opportunities exist to add one 3200 MBH condensing natural gas-fired boiler and operate it as primary boiler to carry the school majority of the season and use the existing boiler system as pure back-up as peak support system during extreme days.

The building is pre-heated and cooled by five McQuay Roof Top Packaged Units ranging in size from 40 to 90 tons. The roof top units are equipped with natural gas furnaces, DX coils, and several with CO<sub>2</sub> sensors. The CO<sub>2</sub> sensors regulate the amount of outside air introduced into the spaces based on occupancy. Most units are also equipped with VFD's on the supply and return fans. Though the overall condition of the roof top units is good, these units currently have only five (5) years of remaining useful life per ASHRAE Expected useful Life (EUL) chart. So retrofits on these units is not cost feasible at this time. But EMG recommends during the replacement that these units be replaced with high efficiency variable speed magnetic compressor driven units with COP of 12 or higher. The data/server rooms are cooled by two 3 ½ ton mini-split system air-conditioning units ranging in size from 1 to 3 tons.

Air is circulated throughout the building via air ducts supplied by the McQuay roof top units. The temperature in the classrooms and offices is controlled by perimeter hydronic radiators and VAV boxes w/reheat coils in the ceilings controlled by individual thermostats that are tied into an off site central Building Automation System, Invensys Network 8000 DDC control system.

Currently the buildings occupied/un-occupied set points for cooling are 75°F/85°F and for heating are 68°F/58°F. The control system appears to be properly commissioned and well maintained.

The Mechanical Equipment Schedule in Appendix E contains a summary of the HVAC Equipment at the property.

| Item   | Measured Values   |
|--|---|
| Major Heating system type/capacity                               | 2 Boilers for Hydronic heating (3,270 MBH ea.) and 5 gas-fired furnaces on RTU's for forced hot air (1000-1750 MBH) |
| Major Cooling System type/capacity                               | 5 RTU's with DX Coils (40-90 Ton)   |
| Heating hot water supply temperature                             | 140°F before mixing valve, 132°F after mixing valve   |
| Outside Air temperature & Relative Humidity (%) at time of audit | 85°F, 36% RH  |
| Interior space temperatures & Relative Humidity (RH%)            | 75°F, 36% RH  |
| Supply Air Temperature (SAT)/Return Air Temperature (RAT)        | Supply Air Temperature: 66°F Return Air Temperature: 75°F   |
| Avg. Supply Air rate (CFM/Sq.ft)                                 | 0.78 CFM/Sq. ft   |
| Avg. Interior space thermostat set-point                         | 75°F  |
| Avg. Outside Air rate (% & CFM/Sq.ft or CFM/person)              | 0% Outside Air, Dampers Closed at time of audit   |

The Mechanical Equipment Schedule in Appendix E contains a summary of the HVAC Equipment at the property.

#### 5.4. BUILDING LIGHTING

Interior lighting in the classrooms, offices, cafeteria, library, bathrooms, hallways, storage, and utility rooms are primarily lit by 2 bulb, 32 watt, T8 fluorescent light fixtures with electronic ballasts. Areas throughout the school are also lit with 3 bulb, 32 watt, T8 fluorescent light fixtures, 2 bulb 26 watt 4-pin quad-tube recessed light fixtures, and 2 bulb indirect lights with 40 watt compact fluorescent tubes.

The gym uses 400 watt metal halide light fixtures. It is being recommended to convert the 400 watt metal halide to 200 watt induction bulbs. The auditorium uses a combination of 100w metal halide and 90 watt halogen light fixtures for the overhead lighting. It is being recommended to convert the 100 watt metal halide to 35 watt LED fixtures, and convert the 90 watt halogen bulbs to 26 watt fluorescent flood lights.

The lighting in the building is controlled predominantly by two-way manual switches. The office in the health suite is the only room in the whole school that is equipped with a motion sensor to control the lighting. New style passive infrared motion sensors not only detect motion but also body heat. EMG recommends installing dual technology wall-mounted motion sensors in all rooms including storage rooms, electrical panel rooms, and bathrooms and ceiling-mounted occupancy sensors for all offices and classrooms.

Site lighting is provided by property-owned 200 & 400 watt metal halide light poles and 2 bulb 26 watt CFL wall pack light fixtures. It is being recommended to convert the 200 watt and 100 watt metal halide to 100 watt and 50 watt induction bulbs respectively. Exterior lighting remains on from 4:00 PM through 11:00 PM and 6:00 AM through 7:30 AM.

| Space type                                    | Measured Light Levels<br>(Lux/foot candles) | ASHRAE/IESNA<br>Recommended Levels<br>(foot candles) |
|---|---|--|
| Classroom                                     | 420 Lux/39 FC                               | 30   |
| Office  | 550 Lux/51 FC                               | 50   |
| Auditorium                                    | 290 Lux/27 FC                               | 10   |
| Gym   | 610 Lux/57 FC                               | 60   |
| Restroom                                      | 600 Lux/56 FC                               | 10   |
| Avg. Building<br>Lighting Density,<br>W/Sq.Ft | 1.92 W/Sq.Ft                                | 1.2 W/Sq.Ft  |

Note: 1 foot candle = 10.764 lux

The Lighting Systems Schedules in Appendix F contain a summary of the Existing Lighting Systems at the property, along with proposed Lighting Energy Conservation Measures.

#### 5.5. BUILDING ELEVATORS AND CONVEYING SYSTEMS

There is one hydraulic service elevator. The elevator has a rated capacity of 3,500 pounds. The elevator machinery is located in a room adjacent to the shaft on the ground floor. The elevator is powered by a 25 HP submersible hydraulic pump.

## 5.6. BUILDING DOMESTIC HOT WATER

The water meter is located in the boiler room.

One 400-gallon gas-fired water heater supplies domestic hot water to the building. The water heater is located in the boiler room. The 140 Deg F water from the hot water heater passes through a mixing valve assembly to provide 132 Deg F water to the bathrooms and sinks in the school. The hot water is circulated through the building with 3 1/8 hp pipe mounted circulation pumps. It is being recommended to turn the temperature of the water at the mixing valve back to 120 Deg F. Also in summer months when school is rarely occupied, it may also be considered to completely turn off the water heater or drop the set point further to 100 Deg F or lower. This will save both natural gas consumption to heat water as well as pumping energy costs.

The common area restrooms have commercial-grade fixtures and accessories, including water closets and lavatories. The toilets consist of 1.6 GPF flush valves. The flush volume of the urinals is 3.5 GPF. The lavatories are equipped with aerators rated at 2.2 GPM. The lavatories are operated by automatic controls.

|                            |             |
|----------------------------|-------------|
| DHW type                   | Natural Gas |
| Storage Tank Capacity      | 400-gallon  |
| Heating/tank set-point     | 140 Deg F   |
| DHW temperature at faucet  | 132 Deg F   |
| Building faucets, GPM      | 2.2 GPM     |
| Water closets/toilets, GPF | 1.6 GPF     |

## 5.7. BUILDING NATURAL GAS AND ELECTRICITY

The building is connected to the natural gas utility (Nstar). The gas main on the adjacent public street supplies the natural gas service. The gas meter and regulators are located in a vault in front of the building. The gas distribution piping within the building is malleable steel (black iron). The facility is master-metered for natural gas.

The electrical supply lines run underground pad-mounted transformer to an interior-mounted electrical meter. The main electrical service size is 2,000 amps, 480/277-volt, three-phase, four-wire alternating current (AC). A step-down transformer is located in the main electrical room. The electrical wiring is copper, installed in metallic conduit. Circuit breaker panels are located throughout the building. The facility is master-metered for electricity.

A natural gas-engine-driven 750 kVA emergency electrical generator is located in a room inside of the boiler room. The generator provides back-up power for elements of the fire and life safety systems. The generator is powered by natural gas.

|  |   |
|--|---|

## 6. UTILITY ANALYSIS

Establishing the energy baseline begins with an analysis of the utility cost and consumption of the building. Utilizing the historical energy data and local weather information, we evaluate the existing utility consumption and assign it to the various end-users throughout the buildings. The Historical Data Analysis breaks down utilities by consumption, cost and annual profile.

This data is analyzed, using standard engineering assumptions and practices. The analysis serves the following functions:

- Allows our engineers to benchmark the energy and water consumption of the facilities against consumption of efficient buildings of similar construction, use and occupancy.
- Generates the historical and current unit costs for energy and water
- Provides an indication of how well changes in energy consumption correlate to changes in weather.
- Reveals potential opportunities for energy consumption and/or cost reduction. For example, the analysis may indicate that there is excessive, simultaneous heating and cooling, which may mean that there is an opportunity to improve the control of the heating and cooling systems.

By performing this analysis and leveraging our experience, our engineers prioritize buildings and pinpoint systems for additional investigation during the site visit, thereby maximizing the benefit of their time spent on site and minimizing time and effort by the customer's personnel.

Based upon the utility information provided about the Broadmeadow Elementary School, the following energy rates are utilized in determining existing and proposed energy costs.

### Utility Rates used for Cost Analysis

| Electricity<br>(Blended Rate) | Natural Gas   | Water / Sewer |
|-------------------------------|---------------|---------------|
| \$0.20/kWh                    | \$1.08 /therm | \$9.00 /kGal  |

The data analyzed provides the following information: 1) breakdown of utilities by consumption, 2) cost and annual profile, 3) baseline consumption in terms of energy/utility at the facility, 4) the Energy Use Index, or Btu/sq ft, and cost/sq ft. For multiple water meters, the utility data is combined to illustrate annual consumption for each utility type.

## 6.1. ELECTRICITY

Nstar satisfies the electricity requirements of the facility. The rise in the electricity usage during the summer months is due to the use of electric driven air-conditioning equipment. The lighting is a large component of the electrical base-load because of both the number and inefficiency of fixtures and bulbs. The kitchen appliances, computers, and copying machines also add significant amounts to the base-load.

Based on the 2010-11 electric usage & costs, the average price paid during the year was \$0.20 per kWh. The total annual electricity consumption for the 12-month period analyzed is 831,080 for a total cost of \$166,491.

### Electricity Consumption and Cost Data

| Start Date   | Electricity Consumption (kWh) | Unit Cost/kWh | Total Cost          |
|--------------|-------------------------------|---------------|---------------------|
| July,10      | 28,580                        | \$0.23        | \$6,636.00          |
| August,10    | 39,480                        | \$0.37        | \$14,648.00         |
| September,10 | 91,880                        | \$0.23        | \$20,820.00         |
| October,10   | 72,500                        | \$0.19        | \$14,101.00         |
| November,10  | 92,280                        | \$0.17        | \$15,274.00         |
| December,10  | 73,240                        | \$0.16        | \$11,870.00         |
| January,11   | 81,000                        | \$0.16        | \$13,018.00         |
| February,11  | 75,460                        | \$0.16        | \$12,431.00         |
| March,11     | 71,140                        | \$0.18        | \$12,876.00         |
| April,11     | 67,400                        | \$0.20        | \$13,184.00         |
| May,11       | 71,940                        | \$0.21        | \$15,017.00         |
| June,11      | 66,180                        | \$0.25        | \$16,616.00         |
| <b>Total</b> | <b>831,080</b>                | <b>\$0.20</b> | <b>\$166,491.00</b> |

### Electricity Usage (kWh)

### Electricity Cost (\$)

## 6.2. NATURAL GAS

The natural gas requirements of the facility are satisfied by Nstar. The rise in the natural gas usage during the winter months is due to the use of natural gas driven heating equipment. The base-load for the building consists of the domestic hot potable water boiler along with some of the kitchen appliances.

Based on the 2010-11 natural gas usage & costs, the average price paid during the year was \$1.07 per therm. The total annual natural gas consumption for the 12-month period analyzed is 34,840 for a total cost of \$37,137.

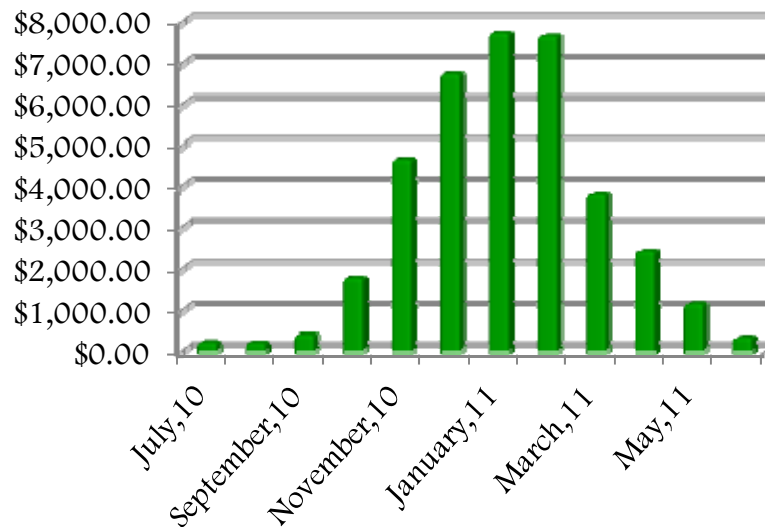

### Natural Gas Consumption and Cost Data

| Start Date   | Natural gas Consumption (Therms) | Unit Cost/therm | Total Cost         |
|--------------|----------------------------------|-----------------|--------------------|
| July,10      | 185                              | \$1.16          | \$219.00           |
| August,10    | 176                              | \$1.16          | \$209.00           |
| September,10 | 417                              | \$0.97          | \$412.00           |
| October,10   | 1,840                            | \$0.93          | \$1,758.00         |
| November,10  | 4,587                            | \$1.00          | \$4,653.70         |
| December,10  | 6,155                            | \$1.08          | \$6,739.00         |
| January,11   | 6,926                            | \$1.10          | \$7,721.00         |
| February,11  | 6,872                            | \$1.10          | \$7,648.00         |
| March,11     | 3,546                            | \$1.07          | \$3,836.00         |
| April,11     | 2,200                            | \$1.09          | \$2,440.00         |
| May,11       | 1,122                            | \$1.02          | \$1,160.00         |
| June,11      | 311                              | \$1.08          | \$342.00           |
| <b>Total</b> | <b>34,337</b>                    | <b>\$1.08</b>   | <b>\$37,137.70</b> |

## 7. ENERGY END USE DISTRIBUTION

Following table shows the annual end-use energy distribution by component for FY 2011 (base year) for Broadmeadow School.

|                 | kWh            | Therms        | kBtu             | % of Total  |
|-----------------|----------------|---------------|------------------|-------------|
| Heating         |                | 31,072        | 3,107,200        | 50%         |
| Cooling         | 168,000        |               | 573,216          | 9%          |
| Ventilation     | 292,395        |               | 997,651          | 16%         |
| Lighting        | 263,325        |               | 898,465          | 14%         |
| Motor & Pumps   | 6,266          |               | 21,381           | 0.3%        |
| Exhaust Fans    | 17,378         |               | 59,294           | 1%          |
| Misc. Equipment | 83,716         |               | 285,639          | 5%          |
| Dom. Hot Water  |                | 3,265         | 326,500          | 5%          |
|                 |                |               |                  |             |
| <b>Total</b>    | <b>831,080</b> | <b>34,337</b> | <b>6,269,345</b> | <b>100%</b> |

*note: FY 2011 (July 2010 – June 2011) is used as baseline year for analysis*

## 8. ENERGY CONSERVATION MEASURES (ECM)

EMG has identified a total of 15 Energy Conservation Measures (ECMs) for this property. All the ECMs are broken into two major categories:

1. **No/Low Cost Recommendations:** No/Low cost is defined as any project with initial investment of less than \$1,000
2. **Capital Cost Recommendations:** Capital cost defined as any project with initial investment greater than \$1,000

EMG screens ECMs using two financial methodologies. ECMs which are considered financially viable must meet both criteria.

1. Simple Payback Period – The number of years required for the cumulative value of energy or water cost savings less future non-fuel or non-water costs to equal the investment costs of the building energy or water system, without consideration of discount rates. ECMs with a payback period greater than the Expected Useful Life (EUL) of the project are not typically recommended, as the cost of the project will not be recovered during the lifespan of the equipment. These ECMs are recommended for implementation during future system replacement. At that time, replacement may be evaluated based on the premium cost of installing energy efficient equipment.

$$\text{Simple Payback} = \frac{\text{Initial Cost}}{\text{Annual Savings}}$$

2. Savings-to-Investment Ratio (SIR) – The savings-to-investment ratio is the ratio of the present value savings to the present value costs of an energy or water conservation measure. The numerator of the ratio is the present value over the estimated useful life (EUL) of net savings in energy or water and non-fuel or non-water operation and maintenance costs attributable to the proposed energy or water conservation measure. The denominator of the ratio is the present value of the net increase in investment and replacement costs less salvage value attributable to the proposed energy or water conservation measure. It is recommended that energy efficiency recommendations should be based on a calculated SIR, with larger SIRs receiving a higher priority. A project is typically only recommended if SIR is greater than or equal to 1.0, unless other factors outweigh the financial benefit.

$$\text{SIR} = \frac{\text{Present Value (Annual Savings, } i\%, \text{ EUL)}}{\text{Initial Cost}}$$

### Key Metrics to Benchmark the Subject Property's Energy Usage Profile

- Building Site Energy Use Intensity - The sum of the total site energy use in thousand of Btu per unit of gross building area. Site energy accounts for all energy consumed at the building location only not the energy consumed during generation and transmission of the energy to the site.
- Building Source Energy Use Intensity – The sum of the total source energy use in thousand of Btu per unit of gross building area. Source energy is the energy consumed during generation and transmission in supplying the energy to your site.
- Building Cost Intensity - This metric is the sum of all energy use costs in dollars per unit of gross building area.

- **Greenhouse Gas Emissions** - Although there are numerous gases that are classified as contributors to the total for Greenhouse Emissions, the scope of this energy audit focuses on carbon dioxide (CO<sub>2</sub>). Carbon dioxide enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, and also as a result of other chemical reactions (e.g., manufacture of cement).

| Site Energy Use Intensity (EUI)            | Rating |                      |
|--|--------|----------------------|
| Current Site Energy Use Intensity (EUI)    | 80     | kBtu/ft <sup>2</sup> |
| Post ECM Site Energy Use Intensity (EUI)   | 68     | kBtu/ft <sup>2</sup> |
| Source Energy Use Intensity (EUI)          | Rating |                      |
| Current Source Energy Use Intensity (EUI)  | 166    | kBtu/ft <sup>2</sup> |
| Post ECM Source Energy Use Intensity (EUI) | 143    | kBtu/ft <sup>2</sup> |
| Building Cost Intensity (BCI)              | Rating |                      |
| Current Building Cost Intensity            | 2.59   | /ft <sup>2</sup>     |
| Post ECM Building Cost Intensity           | 2.23   | /ft <sup>2</sup>     |

#### **Summary of the Greenhouse Gas Reductions from Recommended Energy Conservation Measures**

The following table provides a summary of the projected Greenhouse Gas Emissions reductions as a result of the recommended Energy Conservation Measures:

| Greenhouse Gas Emissions Reduction              | Rating  |                       |
|---|---------|-----------------------|
| Estimated kWh Reduction                         | 113,071 | kWh                   |
| Estimated Annual Thermal Energy Reduction       | 5,226   | Therms                |
| Total CO <sub>2</sub> Emissions Reduced         | 48      | MtCO <sub>2</sub> /yr |
| Total Cars Off The Road (Equivalent)*           | 9       |                       |
| Total Acres of Pine Trees Planted (Equivalent)* | 11      |                       |

\*Equivalent reductions per DOE emissions calculation algorithms.

The following table describes each recommended ECM in terms of initial investment, electricity and natural gas savings, water savings, annual energy cost and maintenance savings, payback and SIR

| List of Recommended Energy Conservation Measures For Broadmeadow School |  |                              |                                 |             |                                |                      |                        |                              |                                     |                |        |                    |                            |

|   | Details: Outside Pole Lights, Gym Lights, and Auditorium Lights     |                              |                                 |             |                                |                      |                        |                              |                                     |                |        |                    |                            |
| 2   | Install Automatic Lighting Controls                                 | \$22,120                     | 0                               | 65,690      | 0                              | 224                  | \$13,160               | \$0                          | \$13,160                            | 1.68           | 5.92   | \$108,872          | 12.00                      |
|   | Details: Install Motion & Occupancy Sensors throughout building     |                              |                                 |             |                                |                      |                        |                              |                                     |                |        |                    |                            |
| 3   | Retro-Commission The Building HVAC & Control System                 | \$30,650                     | 1,554                           | 23,250      | 0                              | 235                  | \$6,338                | \$0                          | \$6,338                             | 4.84           | 2.47   | \$45,013           | 15.00                      |
|   | Details: Balance Flows and Verify Proper Operation of all Equipment |                              |                                 |             |                                |                      |                        |                              |                                     |                |        |                    |                            |
| Total For Capital Cost  |   | \$62,554                     | 1,554                           | 109,309     | 0                              | 528                  | \$23,578               | \$186                        | \$23,764                            | 2.63           |        |                    |                            |
|   | Interactive Savings Discount @ 10%                                  |                              | -581                            | -12,563     |                                | -101                 | -\$3,147               | -\$19                        | -\$3,166                            |                |        |                    |                            |
|   | Total Contingency Expenses @ 15%                                    | \$9,657                      |                                 |             |                                |                      |                        |                              |                                     |                |        |                    |                            |
| Total for Improvements  |   | \$74,035                     | 5,226                           | 113,071     | 3                              | 908                  | \$28,327               | \$167                        | \$28,495                            | 2.60           |        |                    |                            |

If all of the above mentioned ECM's are implemented, Broadmeadow Elementary School could potentially save approximately \$28,495 per year with an investment of \$74,035, yielding a net effective payback of 2.60 years.

---

## **8.1. ECM CALCULATION ASSUMPTIONS**

---

EMG has made the following assumptions in calculation of the Energy Conservation Measures.

- Building operating hours, as detailed in section 5.1 are assumed to be 60 hours per week.
- Annual Heating, Cooling & ventilation Equipment Operating Hours are derived from actual consumption and equipment input rates
- Typical lighting operating hours are assumed to be 12 per day for school season or 2,160 hours per year.

---

## **8.2. No/Low Cost ECM DESCRIPTIONS**

---

EMG has identified 8 No/Low Cost Energy Conservation Measures (ECMs) for this property. This includes all measures which can be implemented below the cost threshold of \$1,000. The following paragraphs describe each of these ECMs along with the initial installed costs, annual energy savings, and payback periods.

---

### **8.2.1. Lower Domestic Hot Water Temperature Set Point**

Lowering the hot water temperature decreases the amount of energy required to heat the water. In addition, distribution piping losses, which are proportional to the temperature difference between the hot water and its surroundings, will be reduced.

Set the water heater thermostat at the lowest temperature at which hot water will meet the occupants' needs. If the demand for hot water fluctuates and a lowered tank temperature will not meet the peak demand, install a mixing valve rather than lowering the tank temperature. If the entire system is set at a high supply temperature to serve the needs of a piece of equipment, consider reducing the tank temperature and installing a booster heater to serve that specific piece of equipment. Note that water in excess of 138°F can cause skin burns.

In the case of Broadmeadow Elementary School the water temperature in the bathrooms was measured at 132°F. The temperature can be adjusted in the boiler room with the mixing valves on the wall with substantial savings and zero cost. EMG strongly recommends the resetting of the temperature to 120°F to save energy. In addition at an elementary school 132°F water could be a hazard.

---

### **8.2.2. Install Timers on Rooftop Exhaust Fans**

Ventilation systems bring fresh outdoor air into the building to provide the occupants with oxygen and to dilute internally-generated air pollutants. Reducing the operating times for discrete ventilation exhaust systems saves fan energy. Curtailing ventilation air reduces heating or cooling loads, except under economizer operation. When a building zone is unoccupied, the ventilation system should be turned off, unless it is "flushing" the building in an economizer mode. Coordinate changes to ventilation air supply with changes to exhaust systems to maintain air balance in the space. Exhaust fans are generally used in areas with high concentrations of pollutants generated from occupants' activities. These exhaust requirements are rarely continuous, and the fans should operate only as needed. Kitchen exhaust fans and make-up air units should only operate while cooking is in progress. This can be accomplished with timers and manual overhead switches. Manual timers are applicable to bathroom exhaust fans. Sensors may be used to shut down fans in intermittently occupied rooms. Care should be exercised in controlling the exhaust from fume hoods used to vent toxic gases in laboratories.

The building has 8 rooftop exhaust fans that are estimated to be continuously running for 9.5 hours a day. The normal hours at the school are from 6:00 AM till 4:30 pm (Monday-Friday). EMG recommends installing a mechanical timer on each rooftop restroom exhaust fan such that it is turned off a few minutes after the restroom lights are turned "off" by the motion sensor. Assuming that the exhaust fan run time is reduced to 4 hours a day, annual run time will be reduced to 1,018 hours each year.

---

### 8.2.3. Install Low Flow Aerators in Water Faucets

By reducing the flow of water coming from the restroom faucets, aerators can generate energy savings at low cost and with easy installation. The savings generated would be in the form of reduced water and sewer costs and at the same time aerators would save energy by reducing the demand for hot water. The average faucet has a flow rate of about 3 to 5 GPM. Adding a screw-in faucet aerator reduces the flow to 0.5 to 1.5 GPM in the bathroom and 2.2 GPM in the kitchen. In addition to saving energy and water, the "foamier" water that comes from faucet aerators wets objects better than water from a faucet with no aerator, which tends to bounce off the object rather than thoroughly wetting it.

In the case of Broadmeadow Elementary School the bathrooms are equipped with 2.2 GPM aerators. EMG strongly recommends the replacement of the aerators with 1 GPM units.

---

### 8.2.4. Install Photo Control Sensors in Stairwells

One of the best ways to save energy is to turn off lights that are not needed. This saves energy, as well as extends the replacement time on lamps. (While frequent switching may in some cases shorten lamp life, the savings in electrical power will more than compensate).

The operating time of lighting systems can be reduced either automatically or manually. Automated controls are more reliable for ensuring that energy savings are achieved. Local switches can be labeled to encourage occupants to turn off lights when leaving an area. Individual switches in perimeter offices permit occupants to reduce lighting levels on sunny days. Sophisticated lighting control systems are available, but they are costly to retrofit. They should be considered when the lighting system is being replaced. With the exception of security lights, storeroom lighting can be placed on timed switches that shut off after the selected interval. All exterior lighting, as well as interior lighting in glass-enclosed vestibules, should be placed on photocell and/or timer control.

In the case of Broadmeadow Elementary School the stairwell lights are on during the day when the windows and skylights let in sufficient light to properly illuminate the area for safe travel. EMG strongly recommends the installation of photo control sensors in these areas.

---

### 8.2.5. Convert Gas Pilot Stove Top and Oven to Electronic Ignition Stove Top and Oven

Having gas pilots continually lit 24/7 can be a substantial waste of energy. This is especially true on large commercial units in schools and restaurants. Using electronic ignition on stoves and ovens instead of gas pilots can completely eliminate this waste. Kits are available for the conversion of old commercial units that are in good condition and likely to have many more years of usage.

In the case of Broadmeadow Elementary School the stove top and oven unit has gas pilots. EMG strongly recommends the conversion to Electronic Ignition in this case.

---

**8.2.6. Install Vending Controls on Soda Machine in Teachers Lounge**

Vending machines are usually designed to operate all day round irrespective of the occupancy level in the office. This means that the vending machines operate for more than 12 hours a day when not required in case of commercial establishments.

There are two types of vend misers; one has a timer in it, which is programmed to turn off or tune down the vending machines after the office hours and bring it back up a hour before the office opens. The other is a motion sensor based system that tunes down the machines upon detecting un-occupancy for a pre-programmed duration of time. In the case of vending machines storing chilled products, the vend miser doesn't turn off the machine entirely, but reduces the operating time of the compressor, such that the machine maintains the products at a minimum tolerable temperature.

In the case of Broadmeadow Elementary School there is 1 soda vending located in the teachers lounges, of which all are non-energy star certified. EMG recommends installing vend misers on these vending machines, which shall automatically reduce the running time of these machines during weekends and unoccupied hours.

---

**8.2.7. Remove Linear Fluorescent 32W T8 Lamps Above Perimeter Bulkhead in Library**

The lighting in office and common areas often tends to warm and bright. Whereas when the LUX readings taken at these locations, are compared to the IESNA lighting standard, it is often observed that the lighting levels are over the prescribed levels. In such circumstances EMG advises to go for de-lamping of individual light fixtures, such that the LUX levels post de-lamping would be in a close range to that of the prescribed limit. The result of de-lamping is reduction in the brightness in the specific areas, but would always be slightly above the recommended IESNA levels. The light readings are taken by hand held light meter, at an approximately table top height from the floor. The advantage of de-lamping is reduction in the demand load as well as the annual lighting energy consumption. EMG recommends taking de-lamping trials at different locations before implementing it across the entire space. When removing fluorescent or HID lamps, also remove or disconnect the ballast to prevent them from continuing to consume energy.

In the case of Broadmeadow Elementary School the lighting above the bulkhead is indirect and more for architectural accents. EMG strongly recommends the decommissioning of these lights since the light levels in the library are above acceptable limits without them.

---

**8.2.8. Utilize Outside Air Temperature Reset Control System in Central BMS System to Control the Boiler**

HVAC equipment is usually sized to meet conditions at the design peak load. Coil water temperature set points are also chosen to meet the design load. However, during most hours of operation, the equipment operates at part-load. Use of design set points on water loops at part-load results in unnecessary thermal losses and equipment inefficiencies. Resetting the set point reduces energy consumption by matching hot or chilled water supply set points to the actual equipment load.

Reset of supply water temperature may be based on the outside air temperature or on the hot or chilled water demand. Except for buildings with dominant internal loads, the space load generally may be considered to be a function of the outdoor temperature. For example, as the outside air temperature rises, chilled water temperature is adjusted upward and hot water temperature is adjusted downward. Alternatively, a more accurate method is to reset the water temperature based on instrumentation readings. For further discussion on the reset strategies and the selection algorithms of the hot and chilled water temperature set points, refer to a report by the National Bureau of Standards, Control Algorithms for Building Management and Control Systems—Hot Deck/Cold Deck/ Supply Air Reset, Day/Night Setback, Ventilation Purging, and Hot and Chilled Water Reset (NBS 1984a).

In the case of Broadmeadow Elementary School the BMS is not utilizing the outside air reset control to its full advantage. The system is designed to be able to use an incremental temperature reset that would significantly reduce the energy requirements of the boiler. EMG strongly recommends the reprogramming of this feature in the BMS system.

### **8.3. CAPITAL COST ECM DESCRIPTIONS**

EMG has identified 4 Capital Cost Energy Conservation Measures (ECMs) for this property. This list includes recommended measures which have an estimated implementation cost of greater than \$1,000. The following paragraphs describe each of these ECMs, in addition to their initial installed costs, annual energy savings, and payback periods.

#### **8.3.1. Replace Metal Halide Lighting in Gym, Auditorium and Exterior Site Lighting w/ Induction Lights**

Induction lighting has the advantage of giving off the same amount of light with half the wattage of a metal halide or high pressure sodium light. Induction lights also last several times longer than the typical HID light. The other advantage to induction lighting is that it is instant on and dimmable, it therefore can be put on motion sensors when equipped with bi-level ballast and operate at 40% power when there is no motion detected and still give substantial site lighting.

In the case of Broadmeadow Elementary School the gym, auditorium, exterior parking lot lighting currently use metal halide lamps. EMG strongly recommends the installation of induction lighting in these areas.

#### **8.3.2. Install PIR Motion & Occupancy Sensors Throughout the School to control lighting**

Lighting systems consume large amounts of energy in most buildings. Energy is saved by reducing both lighting power consumption and the additional cooling load imposed by lighting. In winter, lights do help heat the building; however, in most cases, lighting is a less efficient heating source than the building HVAC system. The lights should be turned off when an area is unoccupied, even if only for a short period. Rooms with intermittent use, such as storerooms, lavatories, etc., should have labeled, individual manual switches so that lights can be turned off when the room is not in use. Occupancy sensors are also effective in spaces that are used intermittently. EMG recommends installing ceiling-mounted occupancy sensors for controlling lighting in large areas and conference rooms and wall-mounted occupancy sensors in individual offices, copy rooms and restrooms.

In the case of Broadmeadow Elementary School there was one occupancy sensor in the whole school. EMG strongly recommends the installation of occupancy sensors throughout the school.

---

### 8.3.3. Recommission HVAC and BMS System

Retro Commissioning (RCx) of HVAC and control systems is a good maintenance practice every five years, especially for Variable Air Volume (VAV) systems. Systems have tendency to go out of balance over a period of time due to changing set-points, maintenance and adjustments. RCx will bring all hydronic and air balancing to original design intent to meet current occupant comfort conditions. Outside Air rates will also be balanced accordingly.

Broadmeadow Elementary School has several roof top air handlers distributing air via VAV-reheat distribution system. Hot water is circulated via two pumps and throttled by 3-way valves. Per discussions with site management, the school systems were never rebalanced and/or RCx'd since 2001 when the School was built. EMG strongly recommends making necessary improvements as recommended and retro-commission the building and HVAC systems and air balance the entire VAV distribution to optimize equipment performance and attain energy savings.

---

## 8.4. MEASURES RECOMMENDED FOR CONSIDERATION

---

---

### 8.4.1. Install VFD's on Motors on Boiler Circulation Pumps

Variable speed drives save energy by sensing the load requirements and changing the motor's power and speed to meet these requirements.

There are two types of variable speed drives: mechanical and electronic. Mechanical variable speed drives consist of either magnetic clutches or variable ratio belt drives that allow the motor to run at a constant speed, while the motor-driven equipment speed varies. Electronic variable speed drives adjust the speed of the motors they control by electronically varying the input voltage and frequency to the motor. Both systems have enormous conservation potential. The electronic drives are more energy efficient than the mechanical, but are also more costly (Usibelli et al. 1985). Centrifugal devices are the best candidates for variable speed drives. Centrifugal fans and pumps for water, sewage, refrigerant, and air are typical applications. Centrifugal devices whose flow rates and pressures are normally controlled by throttling can be replaced with variable speed drives. The more operating time below full load, the greater the payback potential of variable speed drives (NCEL 1984c).

In the case of Broadmeadow Elementary School the two 10 HP recirculation pumps on the boiler do not currently have VFD's. EMG strongly recommends the addition of VFD's to these recirculation pumps and regulate pump speed and in-turn energy consumption relative to actual facility load.

---

### 8.4.2. Insulate Ceiling and Roofs

The amount of heat conduction through ceiling and roof is proportional to its overall heat transfer coefficient (commonly called the U-factor) and the temperature difference between the conditioned space and its surrounding, modified by the effect of solar intensity and wind velocity on the exterior surfaces. One of the most effective ways to reduce heat transfer through ceilings and roofs is to retard heat conduction by adding insulation.

Where the existing roof is sound and directly accessible from an attic or ceiling void, polyurethane foam or mineral fiber may be sprayed on the underside, with rigid batt or other applicable insulation for the inside surface. Insulation, typically fiber-glass batt, may also be laid on the top of a ceiling, taking care not to cover up light fixtures. It is generally not practical to insulate the exterior of the roof unless the roof needs to be replaced. In this case, rigid insulation may be used, and protected with a new roof membrane. As buildings become more insulated, the heat transfer through structural members becomes more significant, especially for buildings with metal structural members. Un-insulated structural members can degrade the performance of the insulation up to 20%, and resultant condensation can cause the structure to deteriorate. Therefore, care should be taken to properly insulate the structural members. Often more energy can be conserved by insulating the ceiling rather than the roof unless the attic is being used for special storage, frequent access is required, or a moderate attic temperature is desired. However, if only the ceiling is insulated, any ducting or piping should be insulated to avoid excessive heat transfer or freezing. It is important to be sure that the attic is ventilated by providing one to two inches of ventilation area per square foot of attic.

In the case of Broadmeadow Elementary School the only insulation in the gym, auditorium, and cafeteria is the rigid insulation under the 4 ply Bituminous roofing system with an R-13 value. EMG strongly recommends the addition of R-19 fiberglass insulation properly encapsulated in a polyethylene membrane to significantly reduce energy losses. This project has relatively less energy cost savings compared to high initial investment. So we are recommending this project under capital improvement category for improved occupant comfort.

#### **8.4.3. Replace existing RTUs with High Efficiency Oil free Compressor driven RTUs**

Existing Roof top units have passed 75% of ASHRAE Expected Useful Life (EUL) and have about five years of Remaining Useful Life (RUL). EMG does not recommend replacing the units at this time as they are relatively in good operating condition. Also compressors and other major components for some units have been replaced in recent years.

But we recommended replacing the units at end of life (estimated to be 5 years based on ASHRAE EUL chart) with High efficiency units with on board VFDs for supply and return fans and oil free magnetic clutch driven variable speed compressors for cooling. These units cost about 25% more than standard efficiency units but in turn operate much more efficiently. EMG performed a cost feasible analysis and it shows a premium recovery rate of 5.35 years with newer units. This measure is strongly recommended at time of replacement.

#### **8.4.4. Install Pulse or Condensing Boilers/Furnaces**

New boilers and furnaces on the markets generally attain efficiencies of above 80%. The efficiencies of pulse and condensing units can be above 90% and reduce the energy requirements considerably.

Boilers or furnaces at or near the end of their service life should be replaced with energy-efficient units. The size of the replacement unit should match the current and projected needs of the installation. Replacing original equipment with modular units with smaller capacities should be considered to reduce the cycling losses.

In the case of Broadmeadow Elementary School the two boilers currently in use are 85.6% efficient per manufacturer specifications. Adding a new boiler or replacing one of existing boilers is not cost effective at this time. So EMG recommends installing one condensing boiler when one of the two boilers is up for replacement. As in the RTU situation, the condensing boilers cost about 25-30% more than standard efficiency boilers and the premium recovery rate is about 7 years which makes the project attractive at that time. EMG strongly recommends at least one of the new replacement boilers be fully condensing and fully pulsating type.

---

## 9. IMPLEMENTATION OF AN OPERATIONS AND MAINTENANCE PLAN

---

The quality of the maintenance and the operation of the facility's energy systems have a direct effect on its overall energy efficiency. Energy-efficiency needs to be a consideration when implementing facility modifications, equipment replacements, and general corrective actions. The following is a list of activities that should be performed (or added as necessary to existing O&M or Preventative Maintenance plan) as part of the routine maintenance program for the property. These actions, which have been divided into specific and general recommendations, will insure that the energy conservation measures identified in this report will remain effective. The following general recommendations should be continued or implemented.

The Broadmeadow school is currently employing good maintenance practices to run the equipment and distribution system in optimal conditions. These practices should be continued along with following checklist items to ensure proper occupant comfort and attain projected energy savings.

### Building Envelope

1. Check Caulking and weather stripping throughout the envelope
  - Currently in good condition. No immediate need noted.
2. Windows inspected periodically for damaged panes and failed thermal seals
  - Currently all windows, doors and seals in good condition.
3. Automatic door closing mechanisms repaired and adjusted as needed
  - Currently all doors closing properly.
4. Roof and insulation checked at least annually
  - Currently in good condition. New insulation improvements recommended for cafeteria and gym.

### Heating and Cooling

1. The burners cleaned and fuel/air ratios optimized during routine maintenance checks
  - Boiler not running at time of audit. But per maintenance burners are cleaned and A/F adjusted annually.
2. Boiler and RTUs inspected and cleaned annually
  - Currently in practice.
3. Temperature settings reduced in unoccupied areas and set points seasonally adjusted.
  - Currently occupied/unoccupied set points maintained by BMS. EMG verified and the system appeared to be monitoring properly. But Retro-commissioning is recommended as an ECM will replace mal functioning sensors.
4. Control valves and dampers checked for functionality semi-annually and repaired, when needed
  - Is recommended as part of retro-commissioning
5. Equipment inspected for worn or damaged parts as part of a monthly maintenance check
  - Currently in practice
6. Ductwork visually inspected and checked for leaks or damaged insulation as part of a semi-annual maintenance check
7. Hot air registers and return air ductwork clean and unobstructed once every 3-5 years
  - Duct work recently cleaned.

8. Air dampers operating correctly
  - Is recommended as part of retro-commissioning. Currently controlled by BMS.
9. Test and balance completed annually to ensure heating uniform throughout the spaces
  - Is recommended as part of retro-commissioning.
10. Evaporator coils and condenser coils regularly checked and cleaned
  - Once every 3-5 years.
11. Air filters inspected monthly and replaced prior to excessive visual buildup (May increase filter costs, but will reduce fan energy costs)
  - Currently in practice.

#### Domestic Hot Water

1. Domestic hot water heater temperature set to the minimum temperature required
  - Recommended as an ECM
2. Hot water piping checked routinely for damaged insulated and leaks
  - Currently in good condition.

#### Lighting

1. Over-lit areas managed by bi-level switching or photocell controls or de-lamping
  - Currently recommended
2. Only energy-efficient replacement lamps used and in-stock for replacement
3. Lighting fixture reflective surfaces and translucent covers clean
  - Currently in good condition
4. Walls clean and bright to maximize lighting effectiveness
5. Rooms controlled by motion or occupancy sensors
  - Currently recommended as ECM
6. Timers and/or photocells operating correctly on exterior lighting
  - Operating properly. Currently on timer and EMG recommends combination of photocell and timer to reduce unnecessary operating hours.

#### Existing Equipment and Replacements

1. Refrigerator and freezer doors closed and sealed correctly
  - Currently kitchen freezers are properly weather stripped and in good condition
2. Kitchen exhaust fans only used when needed or sensors installed to limit operation
  - Currently there are no sensors. School was not functioning at time of audit. But EMG recommends kitchen exhaust hood sensor to shut fan off during day when not needed.
3. Office/ computer equipment either in the “sleep” or “off” mode when not used
  - Smart strips are good application.
4. All other recommended equipment specific preventive maintenance actions conducted

In addition, equipment replacement performed assuring that:

1. All equipment replacements not over/undersized for the particular application
2. All equipment replacements with energy conserving and/or high efficiency devices

## APPENDIX D: GLOSSARY OF TERMS

---

---

### Glossary of Terms and Acronyms

ECM – Energy Conservation Measures are projects recommended to reduce energy consumption. These can be No/Low cost items implemented as part of routine maintenance or Capital Cost items to be implemented as a capital improvement project.

Initial Investment – The estimated cost of implementing an ECM project. Estimates typically are based on R.S. Means Construction cost data and Industry Standards.

Annual Energy Savings – The reduction in energy consumption attributable to the implementation of a particular ECM. These savings values do not include the interactive effects of other ECMs.

Cost Savings – The expected reduction in utility or energy costs achieved through the corresponding reduction in energy consumption by implementation of an ECM.

Simple Payback Period – The number of years required for the cumulative value of energy or water cost savings less future non-fuel or non-water costs to equal the investment costs of the building energy or water system, without consideration of discount rates.

EUL – Expected Useful Life is the estimated lifespan of a typical piece of equipment based on industry accepted standards.

RUL – Remaining Useful Life is the EUL minus the effective age of the equipment and reflects the estimated number of operating years remaining for the item.

SIR – The savings-to-investment ratio is the ratio of the present value savings to the present value costs of an energy or water conservation measure. The numerator of the ratio is the present value of net savings in energy or water and non-fuel or non-water operation and maintenance costs attributable to the proposed energy or water conservation measure. The denominator of the ratio is the present value of the net increase in investment and replacement costs less salvage value attributable to the proposed energy or water conservation measure. It is recommended that energy-efficiency recommendations be based on a calculated SIR, with larger SIRs receiving a higher priority. A project typically is recommended only if the SIR is greater than or equal to 1.0, unless other factors outweigh the financial benefit.

Life Cycle Cost – The sum of the present values of (a) Investment costs, less salvage values at the end of the study period; (b) Non-fuel operation and maintenance costs; (c) Replacement costs less salvage costs of replaced building systems; and (d) Energy and/or water costs.

Life Cycle Savings – The sum of the estimated annual cost savings over the EUL of the recommended ECM, expressed in present value dollars.

Building Site Energy Use Intensity – The sum of the total site energy use in thousand of Btu per unit of gross building area. Site energy accounts for all energy consumed at the building location only not the energy consumed during generation and transmission of the energy to the site.

Building Source Energy Use Intensity – The sum of the total source energy use in thousand of Btu per unit of gross building area. Source energy is the energy consumed during generation and transmission in supplying the energy to your site.

Building Cost Intensity – This metric is the sum of all energy use costs in dollars per unit of gross building area.

Greenhouse Gas Emissions – Although there are numerous gases that are classified as contributors to the total for Greenhouse Emissions, the scope of this energy audit focuses on carbon dioxide (CO<sub>2</sub>). Carbon dioxide enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, and also as a result of other chemical reactions (e.g., manufacture of cement).

Existing Facilities Program Lighting Form:

Performance Based

Project Number:

98515.11R-001.268

Facility Name:

Broadmeadow Elementary School

Project Manager:

Luke Jacques

Date:

8/20/2011

Square Footage (ft2)

87570

| Step:4  | Subtotal Cost of 85 Watt Induction Retrofit                         | \$2,695                                |
| Step:5  | Subtotal Cost of 120 Watt Induction Retrofit                        | \$0                                    |
| Step:6  | Subtotal Cost of 165 Watt Induction Retrofit                        | \$0                                    |
| Step:7  | Subtotal Cost of 250 Watt Induction Retrofit                        | \$8,880                                |
| Step:8  | Subtotal Cost of 300 Watt Induction Retrofit                        | \$0                                    |
| Step:9  | <b>Total Cost For Retrofit</b>                                      | \$9,784                                |
| <b>Energy &amp; Cost Saving Analysis</b>  |   |  |
| Step:10   | Estimated Annual Energy Savings                                     | 20369.00 kwh                           |
| Step:11   | Current Electric Price Per kWh                                      | \$0.20 \$                              |
| Step:12   | Estimated Annual Cost Savings                                       | \$4,081                                |
| Step:13   | Existing Annual Usage (For O&M Savings)                             | 1440 hrs                               |
|   | Proposed Annual Usage Post Retrofit (For O&M Savings)               | 1440 hrs                               |
|   | Estimated Annual O&M Savings  | \$186 \$\$                             |
| Step:14   | Total Estimated Annual Cost Savings (Energy & O&M Savings)          | \$4,267 \$\$                           |
| Step:15   | Simple Pay back Period  | 2.29 Yrs                               |
| <b>Type of Recommendation</b>   |   | <b>Capital Cost ECM Recommendation</b> |
| NOTE: Induction Lamps contain 3 to 4 times the life of HID lamps where significant Operation and Maintenance Savings are attained through minimizing frequency of bulb and ballast replacements |   |  |
